

1 ABSTRACT

5 A removable sealing device for a standard container having a neck, which allows the
container to remain sealed while it is being properly positioned with respect to a receptacle and
then to be remotely unsealed after it has been properly positioned with respect to the receptacle,
10 thereby preventing the contents of the container from spilling on or around the receptacle. A
method of sealing containers involving dispensing removable membranous seals from a continuous
length and attaching the seals to standard containers.
